Chapter 1

Main Page

1.1 Introduction

This project is an implementation of a small and simple packet sniffer, implemented in C#. The packet sniffer application `ipk-sniffer` was build using *sharppacap* library and supports filtering a few different protocol and frame types, which will be listed bellow.

1.2 Build

This application is build using dotnet. However we also include a simple `Makefile` to make the build process of the application itself even simpler on linux. Therefore to build the application on linux, simply run:

```
make
```

To build the application on other platforms, which do not support make, use `dotnet release`.

1.3 Usage

1.3.1 Execution

After building, the application is used as follows.

```
./ipk-sniffer [-i interface | -interface interface] {-p port [-tcp|-t] [-udp|-u]} [-arp] [-icmp4] [-icmp6] [-igmp] [-mld] {-n num}
```

Where: `-i eth0` (just one interface to sniff) or `--interface`. If this parameter is not specified (and any other parameters as well), or if only `-i/--interface` is specified without a value (and any other parameters are unspecified), a list of active interfaces is printed (additional information beyond the interface list is welcome but not required).

`-t` or `--tcp` (will display TCP segments and is optionally complemented by `-p` functionality).

`-u` or `--udp` (will display UDP datagrams and is optionally complemented by `-p` functionality).

`-p port_number` (extends previous two parameters to filter TCP/UDP based on port number; if this parameter is not present, then no filtering by port number occurs; if the parameter is given, the given port can occur in both the source and destination part of TCP/UDP headers).

`--icmp4` (will display only ICMPv4 packets).

`--icmp6` (will display only ICMPv6 echo request/response).

`--arp` (will display only ARP frames).

`--ndp` (will display only ICMPv6 NDP packets).

`--igmp` (will display only IGMP packets).

`--mld` (will display only MLD packets).

Unless protocols are explicitly specified, all (i.e., all content, regardless of protocol) are considered for printing.

`-n packet_count` (specifies the number of packets to display, i.e., the "time" the program runs; if not specified, consider displaying only one packet, i.e., as if `-n 1`)

**** This information can also be displayed by using `--help`**** Upon exit, either organically or using SIGINT, the application complies with standard bash exit codes [\[1\]](#)

1.3.2 Output

Non-printable characters are replaced with period. Output format:

```
timestamp: time src MAC: MAC address with : as separator dst MAC: MAC address with : as separator
frame length: length src IP: IP address if any (support v4 but also v6 representation according to
RFC5952) dst IP: IP address if any (support v4 but also v6 representation according to RFC5952) src
port: port number if any dst port: port number if any byte_offset: byte_offset_hexa byte_offset_ASCII
```

whereby:

- time is in RFC 3339 format
- length is in bytes

1.4 Implementation

In this section, we describe some of the implementation details and specifics.

1.5 Dependencies

The project uses these NuGet packages also included in `*.csproj*` file.

- `PackageReference Include="CommandLineParser" Version="2.9.1"`
- `PackageReference Include="PacketDotNet" Version="1.4.7"`
- `PackageReference Include="SharpPcap" Version="6.2.5"`

1.6 Design and Implementation

The application was designed using Singleton design pattern for class [Sniffer](#), which handles the biggest part of it. It builds on the `sharppacap` library for packet capturing. Application operates in a way which we think allows for fast processing of incoming packets, as the main thread only enqueues incoming packets into a blocking queue and then the processing thread takes these packets one by one. Therefore the actual packet capturing is not slowed down by expensive operations, such as IO and packet parsing.

1.6.1 Device and packet filtering

Firstly, the device specified by interface parameter is opened and then filtering parameters are considered for building the final filter. The final filter is an "OR" of the separate filters, described below.

TCP and UDP filters:

```
( TCP ) ( TCP port port_number )
```

Or

```
( UDP ) ( UDP port port_number )
```

[\[2\]](#)

ICMPv4, ICMPv6 and ARP filters:

```
( icmp ) ( icmp6 ) ( arp )
```

NDP filter:

```
( icmp6[icmp6type] = icmp6-neighborsolicit or icmp6[icmp6type] = icmp6-routersolicit or icmp6[icmp6type]
= icmp6-routeradvert or icmp6[icmp6type] = icmp6-neighboradvert or icmp6[icmp6type] = icmp6-
redirect )
```

[\[4\]](#)

MLD filter:

```
( icmp6[icmp6type] = icmp6-multicastlistenerquery or icmp6[icmp6type] = icmp6-multicastlistenerreportv1
or icmp6[icmp6type] = icmp6-multicastlistenerreportv2 or icmp6[icmp6type] = icmp6-multicastlistenerdone
)
```

[\[3\]](#)

Chapter 2

Class Index

2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

| | | |
|----------------------------------|---|----|
| Options | Argument parser class | 7 |
| PacketInfoParsed | Stores parsed packet information | 10 |
| Sniffer | Sniffer class, packet handler designed as a singleton | 13 |

Chapter 3

Class Documentation

3.1 Options Class Reference

Argument parser class

Static Public Member Functions

- static void [HandleParseErrors](#) ()
Handle errors which may occur while parsing command line arguments
- static void [CheckArguments](#) ([Options?](#) arguments)
Check correctness of command line arguments

Properties

- string? [Interface](#) [get, set]
Interface
- int [PacketLimit](#) [get, set]
Packet Limit
- bool [Tcp](#) [get, set]
TCP
- bool [Udp](#) [get, set]
UDP
- int [Port](#) [get, set]
Port
- bool [Icmp4](#) [get, set]
ICMPv4
- bool [Icmp6](#) [get, set]
ICMPv6
- bool [Arp](#) [get, set]
ARP
- bool [Ndp](#) [get, set]
NDP
- bool [Igmpp](#) [get, set]
IGMP
- bool [Mld](#) [get, set]
MLD

3.1.1 Detailed Description

Argument parser class

3.1.2 Member Function Documentation

3.1.2.1 CheckArguments()

```
static void Options.CheckArguments (
    Options? arguments ) [static]
```

Check correctness of command line arguments

Parameters

| | |
|------------------|--|
| <i>arguments</i> | |
|------------------|--|

3.1.2.2 HandleParseErrors()

```
static void Options.HandleParseErrors ( ) [static]
```

Handle errors which may occur while parsing command line arguments

3.1.3 Property Documentation

3.1.3.1 Arp

```
bool Options.Arp [get], [set]
```

ARP

3.1.3.2 Icmp4

```
bool Options.Icmp4 [get], [set]
```

ICMPv4

3.1.3.3 Icmp6

```
bool Options.Icmp6 [get], [set]
```

ICMPv6

3.1.3.4 Igmp

```
bool Options.Igmp [get], [set]
```

IGMP

3.1.3.5 Interface

```
string? Options.Interface [get], [set]
```

Interface

3.1.3.6 Mld

```
bool Options.Mld [get], [set]
```

MLD

3.1.3.7 Ndp

```
bool Options.Ndp [get], [set]
```

NDP

3.1.3.8 PacketLimit

```
int Options.PacketLimit [get], [set]
```

Packet Limit

3.1.3.9 Port

```
int Options.Port [get], [set]
```

Port

3.1.3.10 Tcp

```
bool Options.Tcp [get], [set]
```

TCP

3.1.3.11 Udp

```
bool Options.Udp [get], [set]
```

UDP

The documentation for this class was generated from the following file:

- ipk-sniffer/Program.cs

3.2 PacketInfoParsed Class Reference

Stores parsed packet information

Public Member Functions

- override string [ToString](#) ()
All attributes converted to string containing the required wireshark packet hexdump format

Properties

- string [TimeStamp](#) = "" [get, set]
Packet time stamp
- string [SrcMac](#) = "" [get, set]
Source MAC address
- string [DstMac](#) = "" [get, set]
Destination MAC address
- string [FrameLenght](#) = "" [get, set]
Frame length in bytes
- string [SrcIp](#) = "" [get, set]
Source IP address
- string [DstIp](#) = "" [get, set]
Destination IP address
- string [SrcPort](#) = "" [get, set]
Source port
- string [DstPort](#) = "" [get, set]
Destination port
- string [ByteOffset](#) = "" [get, set]
Hex and ascii dump

3.2.1 Detailed Description

Stores parsed packet information

3.2.2 Member Function Documentation

3.2.2.1 ToString()

```
override string PacketInfoParsed.ToString ( )
```

All attributes converted to string containing the required wireshark packet hexdump format

Returns

String representation of internal attributes

3.2.3 Property Documentation

3.2.3.1 ByteOffset

```
string PacketInfoParsed.ByteOffset = "" [get], [set]
```

Hex and ascii dump

3.2.3.2 DstIp

```
string PacketInfoParsed.DstIp = "" [get], [set]
```

Destination IP address

3.2.3.3 DstMac

```
string PacketInfoParsed.DstMac = "" [get], [set]
```

Destination MAC address

3.2.3.4 DstPort

```
string PacketInfoParsed.DstPort = "" [get], [set]
```

Destination port

3.2.3.5 FrameLenght

```
string PacketInfoParsed.FrameLenght = "" [get], [set]
```

Frame length in bytes

3.2.3.6 SrcIp

```
string PacketInfoParsed.SrcIp = "" [get], [set]
```

Source IP address

3.2.3.7 SrcMac

```
string PacketInfoParsed.SrcMac = "" [get], [set]
```

Source MAC address

3.2.3.8 SrcPort

```
string PacketInfoParsed.SrcPort = "" [get], [set]
```

Source port

3.2.3.9 TimeStamp

```
string PacketInfoParsed.TimeStamp = "" [get], [set]
```

Packet time stamp

The documentation for this class was generated from the following file:

- ipk-sniffer/PacketParser.cs

3.3 Sniffer Class Reference

[Sniffer](#) class, packet handler designed as a singleton

Public Member Functions

- [Sniffer](#) ([Options](#) arguments)
Create a [Sniffer](#) object
- void [Initialize](#) ()
Initialize packet sniffer Open device and set PacketArrival handler
- void [CapturePackets](#) ()
Capture packets and process them in a separate thread
- void [Filter](#) ([Options](#) arguments)
Set filter for PacketSniffer

Static Public Member Functions

- static void [PrintDevices](#) ()
List all available devices

3.3.1 Detailed Description

[Sniffer](#) class, packet handler designed as a singleton

3.3.2 Constructor & Destructor Documentation

3.3.2.1 Sniffer()

```
Sniffer.Sniffer (
    Options arguments )
```

Create a [Sniffer](#) object

Parameters

| | |
|------------------|--|
| <i>arguments</i> | Command line arguments which influence the way how packet Sniffer is created |
|------------------|--|

3.3.3 Member Function Documentation

3.3.3.1 CapturePackets()

```
void Sniffer.CapturePackets ( )
```

Capture packets and process them in a separate thread

Starts capturing packets on device then start PacketProcessing thread and waits for the thread to be ended and joined back, meaning that correct number of packets was handled. After that, capturing is stopped

3.3.3.2 Filter()

```
void Sniffer.Filter (
    Options arguments )
```

Set filter for PacketSniffer

Parameters

| | |
|------------------|--|
| <i>arguments</i> | Command line arguments containing wanted filters |
|------------------|--|

3.3.3.3 Initialize()

```
void Sniffer.Initialize ( )
```

Initialize packet sniffer Open device and set PacketArrival handler

3.3.3.4 PrintDevices()

```
static void Sniffer.PrintDevices ( ) [static]
```

List all available devices

The documentation for this class was generated from the following file:

- ipk-sniffer/Sniffer.cs
